

InsightForge^{AI}

N2 QUERY PLATFORM

FRAUD-ORIENTED ANALYTICS ENGINEERING AGENT

Transforming **natural language** business questions into **structured analytical plans**. We generate secure, validated SQL to democratize data access through **responsible AI**.

THE BOTTLENECK OF DATA DEMOCRATIZATION

Non-technical teams need fast answers to combat fraud. Traditional methods rely on engineers—creating slow feedback loops, critical bottlenecks, and security risks.

53%

Maximum effectiveness of traditional internal Text-to-SQL chatbots.

Semantic Ambiguity

Models misinterpret internal jargon, shifting metrics, and corporate acronyms. They translate words, not intent.

Technical Unreliability

Standard AI hallucinates non-existent tables, produces syntax errors, and operates blindly without security permissions or governance.

THE PARADIGM SHIFT: SEMANTIC TO INSIGHT

InsightForge AI is not a naive text-to-code wrapper. We eliminate bottlenecks by combining Generative AI, strict Policy Validation, dynamic Human Approval, and end-to-end Observability.

[01]

Operational Transparency

Complete visibility into the AI's operational reasoning.

[02]

Governed SQL

Execution restricted to certified views with strict risk controls.

[03]

Approval Workflows

Human-in-the-loop intervention for high-risk, sensitive queries.

[04]

End-to-End Audit

Comprehensive observability, telemetry, and security logging.

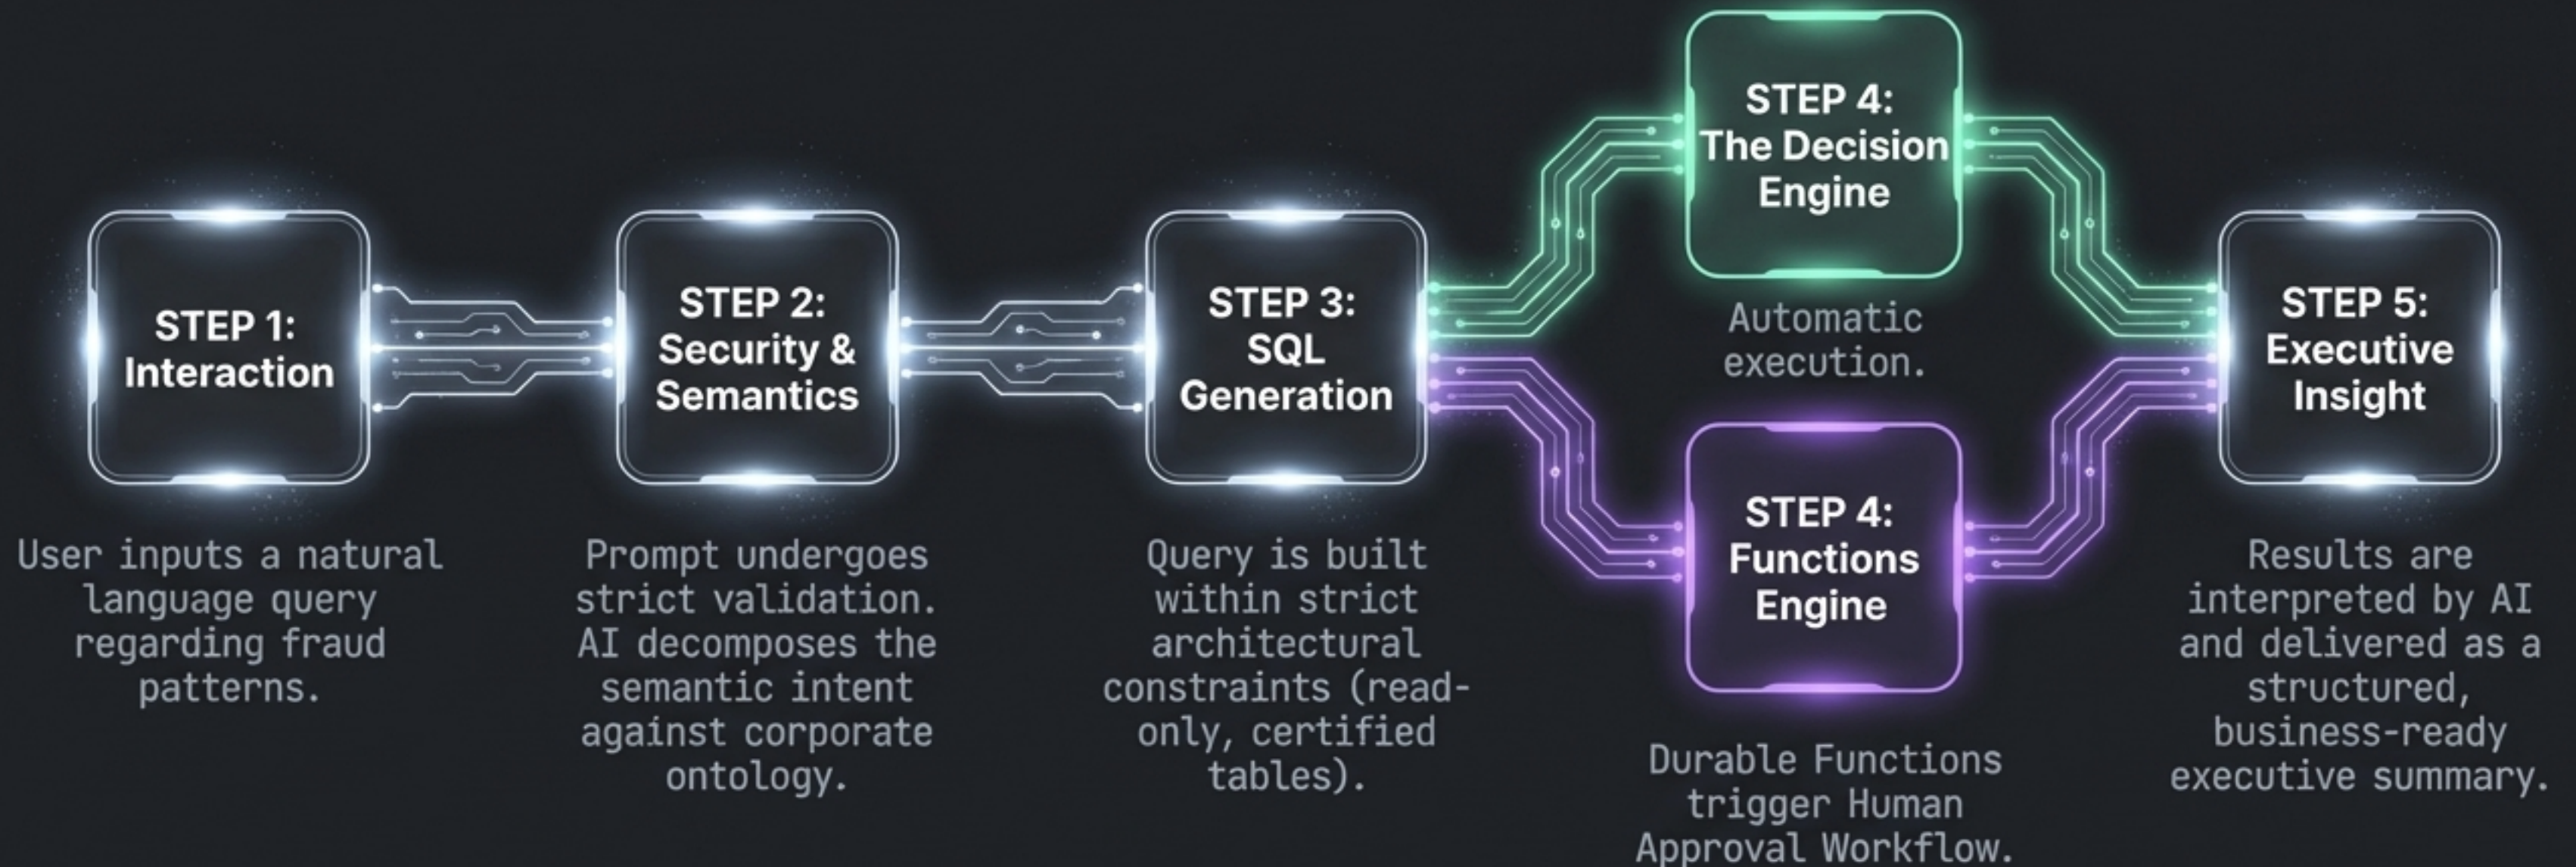

[05]

Vertical Specialization

Purpose-built ontology specifically designed for fraud detection.

THE INSIGHT PIPELINE

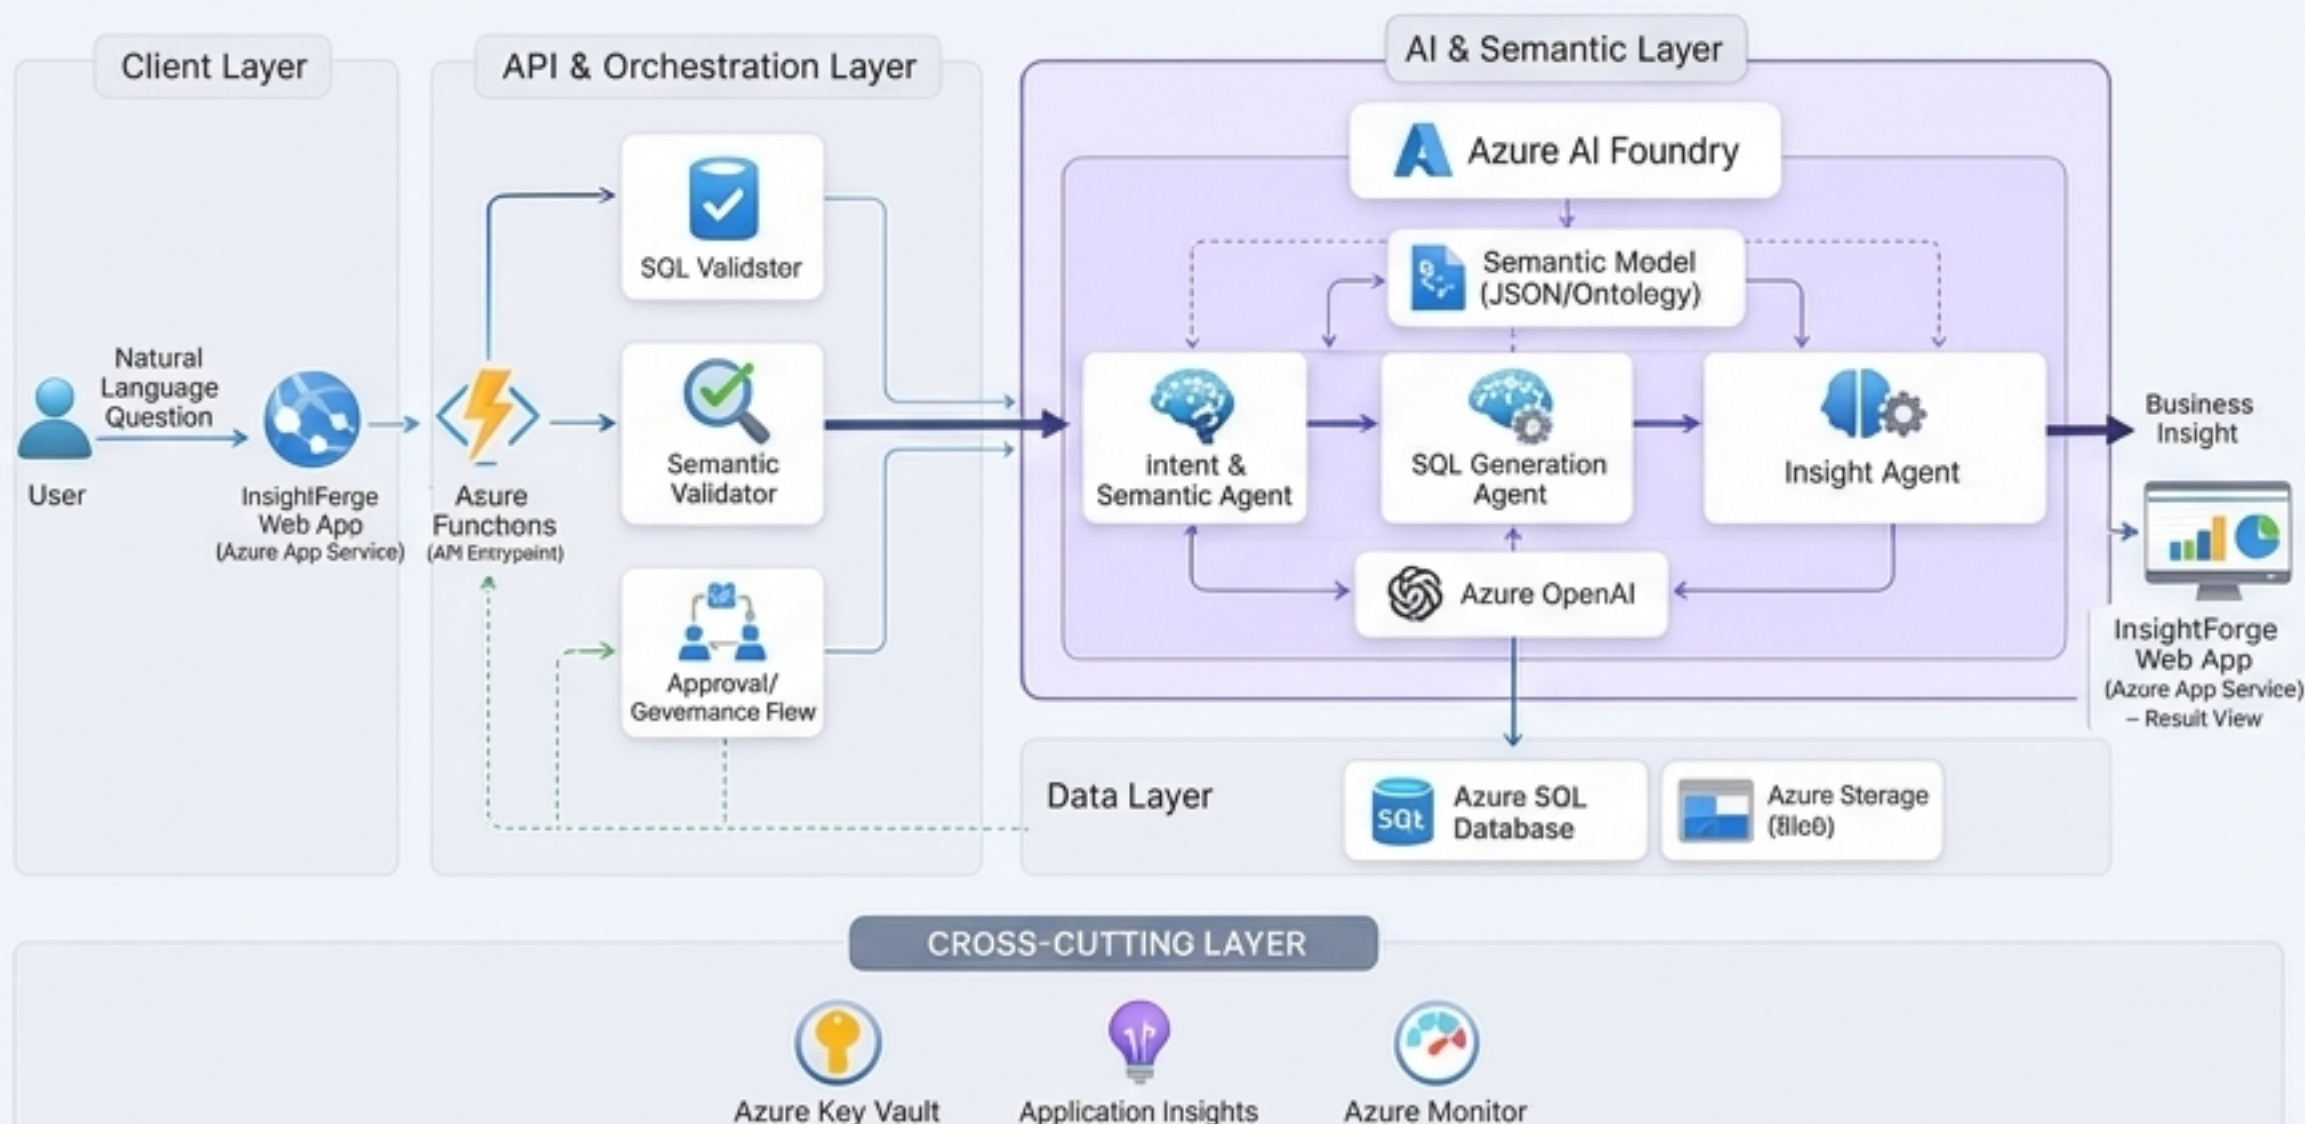

From natural language to executive action.

ENTERPRISE-GRADE CLOUD ARCHITECTURE

InsightForge AI Enterprise Architecture Diagram

Cloud architecture for enterprise-grade Natural Language to SQL & Business Insight on Azure

THE MULTI-AGENT BRAIN & SECURITY CORE

Powered by Azure AI Foundry (gpt-4o-mini)

Cognition / Multi-Agent System

Concierge Agent:

The orchestrator. Manages intent, routing, and user interaction.

SqlPlanner Agent:

The engineer. Translates semantic intent into structured, constraint-bound SQL code.

ResultInterpreter Agent:

The analyst. Converts raw transactional data into highly readable business explanations.

Protection / Enterprise Security

Microsoft Entra ID (IAM):

Identity and access management for strict user authentication.

Azure Key Vault:

Zero-exposure management of API keys, secrets, and connection strings.

Azure AI Content Safety:

Active defense against prompt injection, abuse, and malicious queries.
